What is a solar battery?

A solar battery stores extra electricity your panels make during the day. Instead of sending all unused power back to the grid, some of it can be saved in your battery to use later. Think of it like a rechargeable power bank for your home.

What happens at night?

At night, your solar panels are not producing electricity. If you have a battery, your home can use the energy stored during the day. If the battery runs low, your home will automatically switch to the regular power grid. You will not notice a difference.

What happens if the power goes out?

Without a battery, solar panels connected to the grid automatically turn off during an outage. This protects utility workers.

With a battery, your home can continue running essential items such as:

- Refrigerator
- Lights
- Wi-Fi
- Phone chargers

The system switches automatically. You do not have to flip a switch.
